Bracket fits over battery

Top bolts

You will need the T4 Torx screwdriver to fit the that top bolts.

- 5) Now (unless you want to re-carpet your entire boot floor) you need to make a hole in the bottom boot floor to fit the plastic holding nut through. This is where you need the chewing gum/ blue tack. Place this on the central fixing point on the new bracket:

- 6) Close the boot floor so that the sticky stuff marks the position for you. Then use something sharp to make a guide hole though.

7) Then carefully drill a hole to size with an electric drill.

8) Because of the shape of the bracket you also need to hollow out an area around the small hole for this to fit with a carpet knife or similar.

9) Fit the holding nut through to ensure everything lines up.

10) Position the plastic mounting plate. (This is to protect the carpet I think)

- 11) Position spare wheel over the 5 pointy bits (where the wheel nuts go) and secure again with the holding nut. Job done.
